BEAUTIFUL HAND-CRAFTED SLIDES
Choose from the most extensive range available on the market

For generations, the Synoptophore has been THE standard instrument of choice for the busy orthoptic clinic. It is ideal for the assessment and treatment of ocular motility disorders by reliably performing the most comprehensive binocular vision assessment available today.

Synoptophore slides are beautifully hand-crafted and have been produced for Clement Clarke for nearly a century. The robust slides are compatible with all of the Clement Clarke Synoptophore models.

The range of slides is the most extensive available and they cater for a wide range of binocular vision anomalies. For easy identification, the slides are bound in different colours, according to their category.

Slide Series A
Maddox test (white binding)

Maddox slides can aid the assessment of nine positions of gaze. Horizontal and vertical deviations are assessed in the normal way, however, the examiner may rotate the torsional control until the patient is satisfied that it superimposes in the centre of the surround and all lines run parallel.

Please note, visual angles are approximate; ‘V’ = Vertical, ‘H’ = Horizontal.

Slide Series D
Stereoscopic vision (yellow binding)

A gross qualitative stereopsis assessment can be obtained using two images of the same object, hypothetically taken from slightly different angles, to indicate depth perception. The slides are inserted into the slide holders with the controls of each slide positioned towards or away from the subject. The patient is then required to describe the apparent effect (i.e. a swing moving towards or away from them). The test should be repeated, with the slide controls changing position, to ensure the stereoscopic effect is authentic and the patient is not guessing.

Please note, visual angles are approximate; ‘V’ = Vertical, ‘H’ = Horizontal. Gross Stereoacuity values are included.

Slide Series F
Fusion (green binding)

To assess sensory fusion (the second grade of Binocular Single Vision) two similar pictures each with an incomplete ‘control’ (i.e. rabbit’s tail and a bunch of flowers) are presented to the patient. One tube is locked at zero and the patient is instructed to move the image, as with Simultaneous Perception (SP), and create a composite image of the rabbit holding a bunch of flowers. It is important to question the patient about the ‘controls’ to prove sensory fusion or assess for the presence of suppression. Yet again, if this is difficult for the patient, larger slides may be beneficial.

Please note, visual angles are approximate; ‘V’ = Vertical, ‘H’ = Horizontal.

SKU 6506121
Slide Series G & H
Simultaneous perception (red binding)

The first grade of Binocular Single Vision (BSV), Simultaneous Perception (SP), is tested using two dissimilar pictures, such as a lion and a cage. The tubes are adjusted objectively (by the examiner) and subjectively (by the patient) so that either the lion is perceived to be inside the cage or one image is suppressed. Each slide size has been calculated to subtend a different angle at the nodal point of the eye.

Please note, visual angles are approximate; ‘V’ = Vertical, ‘H’ = Horizontal.
